

RENTAL

MANAGEMENT SYSTEM

RMS

RMS is one of AutoManagement suite modules; designed to enable people invested in vehicle rental business. It allows them to perform all operations related to long term, short term and spot rental activities. RMS helps you track a vehicle movement and uses easy data capture, to be used to identify traffic violation performed during vehicle lifetime of the fleet.

RMS is fully integrated with other modules for various uses; with VMS to allow receipt of vehicles once purchased internally, however; the built in purchase order system allows internal and external purchases. It also integrates with AMS to keep track of the vehicle as an asset and trace its depreciation. Finally RMS is integrated with FMS to trace all financial transactions during the utilization of the vehicle.

Key Features

Long, Short Terms and Spot Rental

RMS is good to use for any type of vehicle rental: for long term contracts, short term ones and spot rental; where the customer walks in and purchases on spot a contract.

Asset Tracking & Depreciation using AMS

RMS has an integrated asset management depreciation function for the rental vehicles. All vehicles are tagged in the AMS system as "rental vehicle assets". This allows the flexibility of generating depreciation in a centralized place with flexible depreciation schemes. The result of the depreciation is used in the RMS system to automatically allocate the depreciation to the respective contracts, in order to analyze the profitability of each contract.

Traffic Violation Management

RMS provides you with a very powerful tool to register all traffic violations electronically (based on data provided by the traffic department), and then detects the person responsible for the violation (based on the movement history available in RMS).

Once a violation is identified, user has the flexibility to define various actions to be taken on the violation. For example, the violation can be passed to the actual driver through a debit note or collected as cash.

The Traffic Violation payment screen allows you to keep track of all recorded violations; and whether the violation has been paid to the traffic department or not. The system provides comprehensive information regarding each violation – i.e. who will pay for the violation and if the customer has agreed to pay, then whether the amount has been recovered or not.

Key Features

Comprehensive Contract Management

RMS supports different kinds of rental contracts (daily rental, monthly lease etc.), and complex management of contracts. You can define a contract for a single car, or several hundreds, and manage all the transactions related to the contract from a single place.

You can define contract terms (such as limits on mileage, method of charging customers and the changes that are allowed during the life of the contract).

For big contracts, RMS supports keeping track of all financial related documents (letters of guarantee, customer documents etc.). Documents can be scanned and stored along with the contract; and access to the customer documents can be restricted to authorized employees.

Full Vehicle History for Service.

Use the full power of the SMS system to control all aspects of vehicle maintenance. The RMS system is integrated with the SMS system. This means any services done or are currently work-in-progress can be reviewed by the rental staff member. The tight integration also means that rental staff has an accurate idea on the maintenance cost incurred on each and every vehicle. This is useful to analyze types of vehicles which are reliable, and those which require regular maintenance (therefore more expensive). The analysis of service costs provides valuable information to the rental staff in setting proper rates for daily rental, weekly rental or monthly rental.

MORE Features

- **Consolidated Customer Database**

This is crucial for preparing long-term strategies which focuses on CRM (Customer Relationship Management).

- **Complete Purchasing Cycle**

Once the life of the rental vehicle is over, the system seamlessly moves the vehicle out from the asset register and transfers to the VMS system for selling as used vehicle.

- **Complete Track of Vehicle Movements**

Vehicle movements are recorded for both date & time, in order to ensure that each minute of the movement is accounted for. This is especially important when you have a large fleet of vehicles, and large number of traffic violations.

- **Comprehensive Security**

Each user in the system can be given specific access that defines what he/she can or cannot do. Audit logs allow the administrators to review the kind of changes being done by users.
